Specifications

Traffic Controller

It should be a microprocessor-based controller fully electronic which has been designed, to be a modular controller built to meet Kimberley's unique, very hot temperature and demanding operating conditions and requirements. The modular hardware designed with stage-based software to produce a highly configurable, user friendly traffic light controller and easy maintenance. A simple and robust user interface is standard and allows easy access to information such as synchronisation status, current plan and stage, RTC setup and fault-finding diagnostics. The controller should be expandable from a minimum of four phases to a maximum of sixteen, in four phase increments. All phases are equipped with hardware to switch red, yellow and green signals, and any phase should be configured as a vehicular phase, turning phase or pedestrian phase. Both GPS clock synchronisation as well as remote monitoring and management (via GPRS or Ethernet) must be possible with the controller.

- Microprocessor based, fully electronic.
- Modular in design for easy maintenance
- LED phase indicators on the driver modules
- Dual Green to Green Conflict Monitoring
- Last Red out monitoring
- Selectable Lamp Monitoring for LED, Incandescent & QH
- Front connecting cable looms for quick & easy replacement.
- SD card for configuration transfer and download
- Fuse protected driver output PSU with LED indicators.
- 16 Detector inputs & 8 auxiliary inputs

- External Flasher facility
- Advanced Manual Panel facility
- Communication: GPRS, Wi-Fi, LAN and Zigbee
- GPS Real-time clock for wireless sync
- Handheld Unit for easy diagnostics
- Cabinet has 3-way locking mechanism.

CONTROLLER CABINET

The controllers must be manufactured with a heavy gauge, steel cabinet. This is ideal for areas where theft and vandalism are rife. The weatherproof cabinet should be a lockable using a custom, vandal resistant lock. After all bending, punching and cutting has been done, the cabinet components must all be hot dip galvanised and riveted together thus eliminating corrosion on overlapping joints. Cabinets must be plinth mount.

POWER SUPPLY

The controller must be designed to operate from a 230 VAC 50 Hz power supply within a voltage range of 190 VAC to 280 VAC. Incorporated into the controller should be a voltage window circuit. This circuit must be built to withstand continuous voltages of up to 500 VAC and should mechanically isolate the controller from the mains supply if the voltage is below or above the operating window - this should ensure that neither the controller nor the LED signals on the controller's outputs are damaged by a persistently high supply-voltage. It is common for continuous voltages in excess of 400 VAC to be experienced in South Africa due to the high rate of cable theft. The window comparator must also ensure Plinth-mount steel cabinet with security lock that the controller is switched off in the event of a low supply voltage which should otherwise lead to unpredictable behaviour. If the power supply is interrupted for 200ms or less the controller must continue normal operation. In the event of an interruption greater than 200ms the controller must shut down and resumes the normal start up procedure when power is restored.

LIGHTNING AND SURGE PROTECTION

Lightning and surge protection must be fitted to the main input of the controller. The voltage window circuit must also have its own surge protection which, if damaged, should prevent the controller from being powered up until the surge suppressor is replaced. This should prevent the removal of damaged surge suppression without replacement, a common mistake made by technicians which leaves the controller vulnerable. All inputs to the controller must be optically isolated and all triac-driven lamp outputs must also be optically isolated from the low voltage circuitry. All high-voltage inputs used to monitor signal returns and conflict must also be equipped with surge protection.

MODULES

The controller must be completely modular, making on-site part replacement quick and easy. The following are the main modules which comprise a controller: • The Chassis (including power supplies, wiring harnesses, surge protection and the voltage window comparator circuit) • The Main Processor Unit (including LCD user interface) • The Four-Phase Output Modules (each output module has four

fused, pluggable triac boards). The chassis allows for mounting of up to four of these modules. The signal output terminals are incorporated into this unit. • The vehicle detection / pedestrian push button input modules (the controller must be compatible with inductive loops, magnetometers or camera detection).

START-UP PROCEDURE

On powering up, the controller must switch to flashing red for 10 seconds, followed by an all red period of 5 seconds before switching to Stage 1. The above values should allow to be adjusted in the configuration file if there is a need.

LOOP DETECTORS AND PEDESTRIAN INPUTS

The controller must be compatible with three vehicle detection types, namely: • Inductive loop detectors • Magnetometer detectors • Camera vehicle detection for each of the above detection methods, the controller should be fitted with the appropriate detection adaptor. The controller must have 20 inputs which can be configured for either vehicular detection or pedestrian push-button input. Any input can be assigned to any one of the available phases and gap times as well as presence times must be configurable. If required, more than one input can be assigned to a single phase. The standard adaptors must allow for the following input combinations: • 12 inductive loops with 8 pedestrian pushbuttons or • 8 magnetometer inputs with 8 pedestrian pushbuttons or • 12 camera inputs with 8 pedestrian pushbuttons.

COMPONENT LABELLING AND DOCUMENTATION

All components must be clearly labelled and a comprehensive manual covering hardware modules, fault finding as well as configuration should be available inside each controller. Controllers which have been configured by the factory for specific intersections will be supplied with the dedicated documentation to facilitate installation.

SIGNAL SWITCHING

Signal switching must be a solid state, a 16 Amp triac is used for each signal output. Each phase is switched by a daughter board containing a 2 A ceramic fuse, three 16 A triacs (red, yellow and green), and the necessary optical isolators. All three triacs applicable to a phase are protected by the replaceable fuse. Furthermore, if a triac or optical isolator is damaged, the pluggable daughter board can be replaced on site and is relatively inexpensive.

OPERATING MODES

The controller must be designed to operate in any of the following modes: • Fixed time operation. • Semi vehicle actuated operation. • Fully vehicle actuated operation. • Fully vehicle actuated operation and, in absence of demand, rest on the last phase demanded or on main road green or rest in red. • Emergency flashing. • Manual control operated by a police switch or user interface. Under manual control minimum green, amber and all red periods must be pre-set to ensure safe operation.

DELAYED PRESENCE

Time delays on presence loops as well as extension loops must be provided to prevent phases being called unnecessarily. The time delays should be set in the controller, which means that no delays have to be set up on the vehicle detection equipment.

PROGRAMME STORAGE

The controller's firmware and software must be accessible to the user and should be stored on non-volatile flash memory and all the configuration files (plans and the RTC schedules) are stored on removable storage - namely a micro-SD card. The micro-SD allows configuration to be easily changed on site without the risk of carrying expensive, thievable equipment such as a laptop. When the power to the controller is toggled, the controller will load and run the configuration saved on the newly inserted SD card.

System capability

- Traffic Remote Management System (RMS) available
- Windows based operating system for security
- Controller faults reported back to RMS.
- Timing and Plan changes can be implemented remotely.
- Multiple User access
- RMS Real-time clock maintained via GPS.
- Stores historical data.
- Fault Tracking Capability from notification, acknowledgement to repairs.

CERTIFICATE OF INDEPENDENT BID DETERMINATION

- 1 This Municipal Bidding Document (MBD) must form part of all bids invited.
- 2 Section 4 (1) (b) (iii) of the Competition Act No. 89 of 1998, as amended, prohibits an agreement between, or concerted practice by, firms, or a decision by an association of firms, if it is between parties in a horizontal relationship and if it involves collusive bidding (or bid rigging). Collusive bidding is a *pe se* prohibition meaning that it cannot be justified under any grounds.
- 3 Treasury Regulation 16A9 prescribes that accounting officers and accounting authorities must take all reasonable steps to prevent abuse of the supply chain management system and authorizes accounting officers and accounting authorities to:
 - a. disregard the bid of any bidder if that bidder, or any of its directors have abused the institution's supply chain management system and or committed fraud or any other improper conduct in relation to such system.
 - b. cancel a contract awarded to a supplier of goods and services if the supplier committed any corrupt or fraudulent act during the bidding process or the execution of that contract.
- 4 This MBD serves as a certificate of declaration that would be used by institutions to ensure that, when bids are considered, reasonable steps are taken to prevent any form of bid-rigging.
- 5 In order to give effect to the above, the attached Certificate of Bid Determination (MBD 9) must be completed and submitted with the bid:

Includes price quotations, advertised competitive bids, limited bids and proposals.

Bid rigging (or collusive bidding) occurs when businesses, that would otherwise be expected to compete, secretly conspire to raise prices or lower the quality of goods and / or services for purchasers who wish to acquire goods and / or services through a bidding process. Bid rigging is, therefore, an agreement between competitors not to compete.

CERTIFICATE OF INDEPENDENT BID DETERMINATION

6. The bidder has arrived at the accompanying bid independently from, and without consultation, communication, agreement or arrangement with any competitor. However, communication between partners in a joint venture or consortium will not be construed as collusive bidding.

9. The terms of the accompanying bid have not been, and will not be, disclosed by the bidder, directly or indirectly, to any competitor, prior to the date and time of the official bid opening or of the awarding of the contract.

Joint venture or Consortium means an association of persons for the purpose of combining their expertise, property, capital, efforts, skill and knowledge in an activity for the execution of a contract.

10.
